

# Bolt Bis-Tris Plus mini gels

Neutral-pH gel system with a unique wedge well design

Bolt Bis-Tris Plus gels are precast polyacrylamide gels designed for optimal separation of a broad molecular weight range of proteins under denaturing conditions during gel electrophoresis (Figures 6 and 7). These gels help deliver consistent performance with a neutral-pH environment to minimize protein degradation. The unique wedge well design (Figure 5) allows loading of up to 2x more sample volume than other precast gels. Bolt gels are ideal for western blot transfer and analysis along with any other technique where protein integrity is crucial.

## Bolt Bis-Tris Plus gels offer:

- **High sample volume capacity**—wedge well design allows detection of proteins in very dilute samples or measurement of low-abundance proteins
- **Preserved protein integrity**—neutral-pH formulation minimizes protein modifications
- **Superior band quality and band volume**—Bolt Bis-Tris Plus gel chemistry is designed to deliver sharp, straight bands with higher band volume
- **Better protein resolution**—gels are 10% longer, allowing detection of more protein bands than standard mini gels
- **High lot-to-lot consistency**—coefficient of variation (CV) of only 2% for  $R_f$  values (migration)

# Broad molecular weight protein separation

## Bis-Tris chemistry: optimized protein separation for high-sensitivity applications

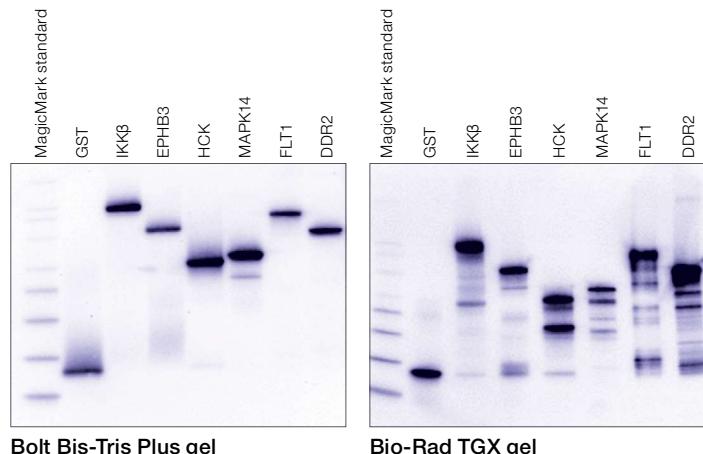

The Bis-Tris gel chemistry provides a neutral-pH environment that minimizes protein degradation. Additionally, preserving protein integrity becomes particularly important when separating low-abundance proteins. Bis-Tris chemistry gels are offered as Bolt Bis-Tris Plus mini gels and NuPAGE Bis-Tris mini gels. Bolt Bis-Tris Plus mini gels are designed for optimal separation of a broad molecular weight range of proteins under denaturing conditions during gel electrophoresis. The unique WedgeWell™ design allows loading of up to 2x more sample volume than other precast gels. Bolt gels are ideal for western blot analysis and applications where protein integrity is crucial and higher sensitivity is required.

### Benefits you can expect from Bolt Bis-Tris Plus gels include:

- **Preserved protein integrity**—neutral-pH formulation minimizes protein modifications or degradation that can result in poor band resolution
- **High sample-volume capacity**—WedgeWell design allows detection of proteins in very dilute samples or visualization of low-abundance proteins
- **Superior band quality and band volume**—Bolt Bis-Tris Plus gel chemistry is designed to deliver sharp, straight bands with higher band volume
- **Better protein resolution**—gels are 10% longer, allowing detection of more protein bands than standard mini gels
- **High lot-to-lot consistency**—coefficient of variation (CV) of only 2% for  $R_f$  values (migration)
- **Optimized run conditions**—separate your proteins using constant voltage in approximately 35 minutes

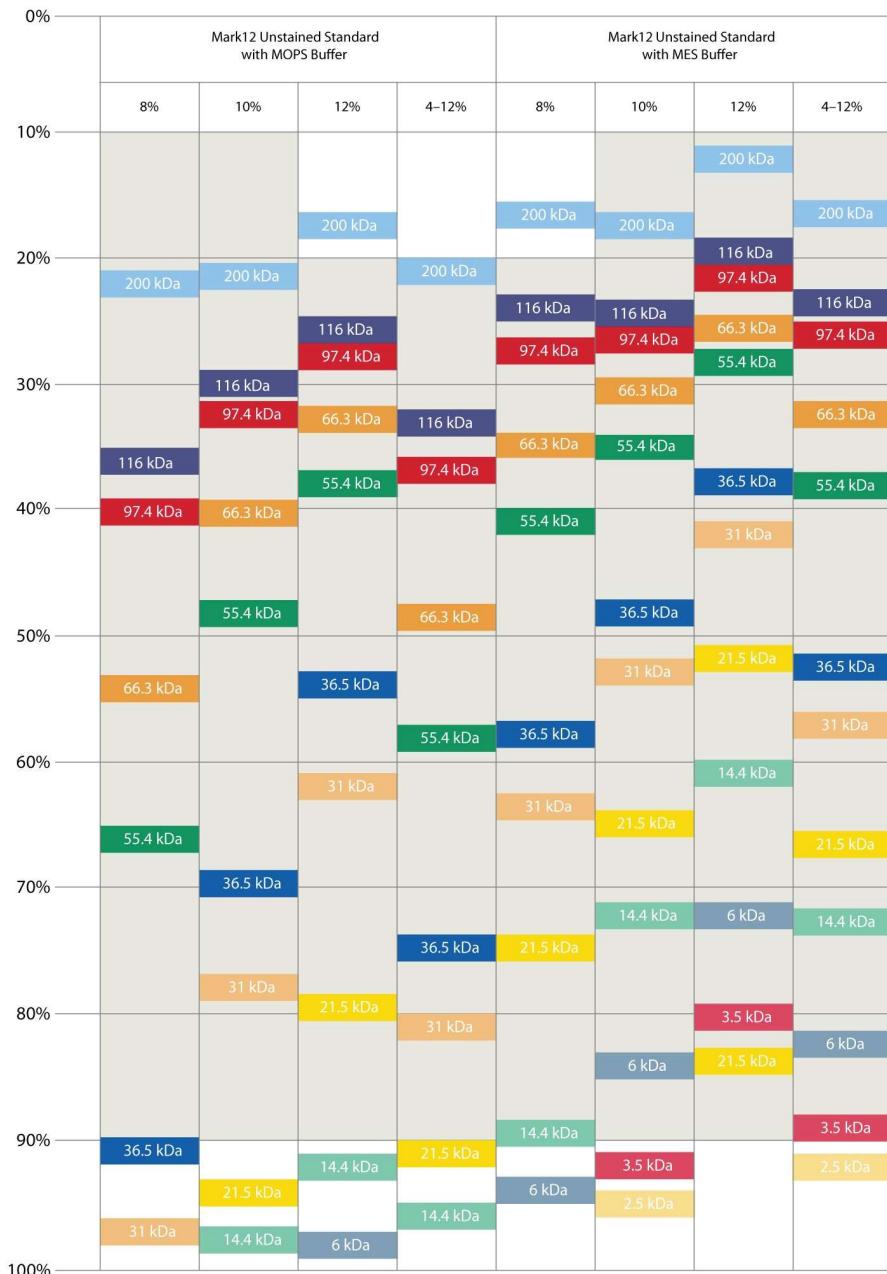

Wedge-shaped well design of Bolt Bis-Tris Plus mini gels.

**Bolt Bis-Tris Plus mini gels help provide better western blotting results.** A western blot of a Bolt gel shows clean, sharp protein signals corresponding to only full-length proteins, whereas a western blot of a Bio-Rad™ TGX™ gel shows multiple low molecular weight degradation products. Protein kinases implicated in cancer (IKK $\beta$ , EPHB3, HCK, MAPK14, FLT1, and DDR2) were analyzed on a Bolt Bis-Tris Plus gel and a Bio-Rad TGX Tris-Glycine gel. The purified kinases (50 ng each), along with Invitrogen™ MagicMark™ XP Western Protein Standard and purified recombinant GST protein, were loaded on a 10-well, 4–12% Bolt gel and a 10-well, 4–20% Bio-Rad TGX gel. The samples were separated and transferred to 0.45  $\mu$ m PVDF membranes using the respective manufacturers' protocols. Immunodetection was performed using an anti-GST antibody and Invitrogen™ WesternBreeze™ chemiluminescence detection. The blots were imaged using an LAS-1000 system (FujiFilm).

## Bolt Bis-Tris Plus gels

**Figure 7. Bolt Bis-Tris Plus gel migration chart.** Optimal separation range is shown within the gray areas.

The new Bolt™ system is wonderful. I am still amazed that I can run a PAGE gel in 23 minutes. The entire system is incredibly user friendly from the Bolt™ precast gels with wedged wells for ease of loading to the Mini Gel Tank system. The bands produced from the westerns were sharp and straight. I would and have highly recommended this system to anyone doing protein work.” —Crystal M., Queen’s University, Ontario, Canada

“For one of our projects in the lab, we resolve proteins by electrophoresis to determine the accumulation of ubiquitinated proteins following treatment with a proteasome inhibitor. When we resolved the ubiquitinated proteins using the Tris-glycine gels, we observed a smear. However, when we switched to resolving the ubiquitinated proteins using the Bolt Bis-Tris gels, we were delightfully surprised to observe individual protein bands in place of the smear.” —Susan S., University of Pennsylvania, Philadelphia, US

The Bolt Welcome Pack + iBlot 2 System.

**Greater sensitivity with Bolt Bis-Tris Plus gels.** Total cell extracts from A431 cells were transferred to NC and PVDF membranes from a 4–12% Bolt Bis-Tris Plus gel, and 4–20% Tris-Glycine precast gel using the Invitrogen™ iBlot™ 2 Gel Transfer Device. The cells were treated with 100 ng/mL of human epidermal growth factor (hEGF) to up-regulate expression of the phospho-EGF receptor. The protein loads of the cell extracts ranged from 20 µg to 1.2 µg of extract. The blots were processed on the Invitrogen™ iBind™ Western System with a 1:200 dilution of Phospho-EGF Receptor (Tyr1068) (1H12) Mouse mAb (Cell Signaling Technology) and a 1:2,000 dilution of anti-mouse HRP secondary antibody (Jackson ImmunoResearch). Detection was performed with Invitrogen™ Novex™ ECL HRP Substrate. Detection sensitivity was nearly two-fold greater using blots from Bolt gels compared to blots from Tris-glycine gels.
